THE MOMENT

"I meant to send it. The week got away from me."

ILLUSTRATIVE PERSONA, NOT A CLAIMED INTERVIEW

Maria works in Singapore, one of over 221,000 Filipino workers there. Payday comes. Some months she remembers to send money home, some months a long shift pushes it to next week. She wants a standing plan she sets up once, then signs each month on a habit, not from memory.

Her mother, back home in the Philippines, has never used a banking app. What she actually wants is to walk in, show her ID, and leave with cash. Today the recipient still needs a Stellar address; cash pickup for her mother is the next milestone.

One anchor in the Philippines reaches every market Filipino workers send from

Only the receiving side needs a Stellar anchor. Wherever the sender is, they just need XLM/USDC sitting in their own wallet. Singapore's OFWs alone also account for 7.3% of all 2025 PH cash remittances, the #2 source country after the US.

Plan, sign, and verify on-chain today

TODAY · WORKING

- Freight + custom signed `manageData` session, not SEP-10
- Support-plan records; reminder day is metadata only
- XLM escrow/release, 60-ledger demo cadence
- Direct XLM/USDC to a recipient address the sender enters and confirms
- Horizon/RPC verification, SEP-7 link, recipient watcher
- Status ends at **Verified on-chain**

NEXT · PLANNED

- Licensed provider onboarding, KYB/compliance, agreements
- SEP-1 + provider SEP-10 + hosted SEP-24
- KYC, quote/limits, approved deposit routing
- Provider transaction status and reference
- PHP cash-out and provider-confirmed collection

ONE SIMPLE FLOW

Sender → Stellar → Anchor → Receiver

Solid border marks what's built today; dashed marks what's still ahead. Once the anchor connects, funds land in MoneyGram's own Stellar account, then flow into their agent network across the Philippines. Her mother just needs a reference number and a photo ID to walk out with cash.

One Philippines anchor serves every sending market

ARCHITECTURE

- Only the receiving side needs a Stellar anchor. A sender in the UAE, Saudi Arabia, Singapore, or anywhere else just needs XLM/USDC in their own wallet, bought on any exchange
- No separate integration per sending country, no separate deal per market
- The Philippines is the one place Bakti needs a licensed cash-out partner

CONFIRMED ANCHOR

- MoneyGram Ramps has been running in the Philippines since October 2021, one of the first four countries when MoneyGram launched this with Stellar, alongside Canada, Kenya, and the US
- Funds land in MoneyGram's own Stellar account. The recipient just shows a reference number and photo ID to pick up cash, no wallet needed
- What's still pending is Bakti's own connection to it: an email is out, no reply yet, nothing's confirmed as a partner

A one-off transfer versus a standing habit with proof attached

Classic apps and bank transfers happen once: no standing plan, no proof beyond a receipt, and the recipient still needs a bank account or a wallet of their own. Bakti skips the wallet requirement on the recipient's side, gives the sender a Stellar transaction they can actually point to, and turns "did I remember this month" into a habit that's already set up. The network layer itself costs next to nothing; what's still missing is the anchor's own cash-out quote.

Sizing the corridor: TAM \$9.3B → SAM \$1.6B → SOM \$16M

TAM comes from 2025 cash-remittance volume in 5 of Bakti's 7 confirmed sending markets (UAE, Saudi Arabia, Singapore, Japan, Hong Kong); a floor, since BSP doesn't break out South Korea or Malaysia separately. SAM applies each market's own crypto-ownership rate to that volume, the senders who already hold crypto today. SOM is a 1% slice of SAM to aim for in year one or two, a goal to work toward, not a promise.

Where the fee comes from, and what we still don't know

UNVALIDATED BUSINESS MODEL

- Main path: a sender-paid fee bundled into the provider's quote. At 2% (under the 6.36% world average), SOM's \$16M works out to roughly \$300K a year, a sanity check, not a projection we're standing behind
- Also possible: provider referral or revenue share, where contracts and regulation allow it
- Also possible: employer or worker-community distribution, paid by an organization instead of the individual sender
- Still open: whether senders actually tolerate this fee, what a provider will share, and the real cost per transaction

GTM EXPERIMENTS

- Interview Filipino workers abroad (any market) and family recipients in the Philippines
- Test planning/reminder value before automation
- Follow up on the MoneyGram Ramps email, without claiming a partnership
- Map how senders in each market actually acquire XLM/USDC today (exchange on-ramps in UAE, Saudi Arabia, Singapore), the same senders SAM counts
- Run testnet usability studies for signing and address safety

A working mainnet core, with an honest last-mile gap

BUILT

- Contract itself: live on mainnet since 2026-07-12, creator key under review
- Separately: a fresh, judge-facing demo transaction is pending, to be signed before submission
- Direct payment verification and support-plan UI
- Current endpoints stop at Verified on-chain

ASK

- Warm introduction to MoneyGram Ramps, or feedback on the outreach email already sent
- Customer-discovery introductions among Filipino worker communities abroad
- Feedback on the planning job before adding automation

Not built: SEP-24, anchor API/webview, KYC, provider routing/status/reference, PHP cash-out, automatic scheduling. Contract: CBVAZDK2GAX5MJ7SSSQKRLY33TO7Q6DG3ZGZK6WMZSGI63XRMIR2CTHR, stellar.expert/explorer/public/contract/CBVAZDK2GAX5MJ7SSSQKRLY33TO7Q6DG3ZGZK6WMZSGI63XRMIR2CTHR

The target value, in one line.

A sender signs once a month. Her mother just walks in and picks up cash — no wallet, no app to install, nothing about blockchain to figure out. That part isn't built yet; the anchor connection is what gets us there.
