

## CURRENT VS TARGET

## Phase 1 shipped. Phase 2 is one anchor away.

### Phase 1 — shipped

- Soroban BaktiEscrow deployed on Stellar mainnet.
- Non-custodial signing, every payment in the sender's own wallet.
- Signed-challenge auth (not SEP-10), SEP-23 muxed attribution, SEP-7 pay links.
- SEP-24 cash\_pickup off-ramp built to spec, run against a simulated anchor.
- End-to-end payout — sign → verify → off-ramp → pickup — proven on testnet.

### Phase 2 / 3 — target

- Production anchor: **MoneyGram Access** or **Coins.ph** — going live is a config swap, not a rewrite.
- Real 30-day payout cadence.
- Pilot corridor live on mainnet with a signed anchor.
- Multi-corridor, licensed rails.

What's real today: contract, app, every signed payment — all on Stellar mainnet.
